

A Probabilistic Analysis of a Network Model based on the generalization of the Polya's Urn Problem

Daisuke Harada, Taizo Chiyanobu, Hiroyoshi Miwa

Many real network have a power-law degree distribution and they are called scale-free. It is known that a network generated by a model with the grown and the preferential attachment properties is scale-free. We prove that a network by a model with the only latter property has the geometric distribution.
